

WEB PAGES with HTML

LESSON 13: Web Page - Composing

In this lesson you will:

- Download text from a word processing file
- Add background and text color
- Change font types and sizes as well as text alignment

Directions:

- Using Notepad, insert all your basic tags. (It might be helpful at this time to set up a template file that contains all your basic HTML tags so that you can just open it each time you begin a new job.)
- Insert the following between the title tags: *Star Spangled Banner*
- Go to the ETCdir drive, Web Design, and open the Word file - *The Star*. Copy the words to the Star Spangled Banner into the body of your notepad file.
- The body background color of your page will be BLUE. The title will be RED and a size 1 heading. The author of the song will be a size 3 heading and RED. To change your font to a red color, use the following tag:
heading goes here
- Insert a horizontal rule that is a size 3 and a width of 50%.
- For the words of the song, use the Arial font that is size 3 and color WHITE. For example:
- Format the words to the song by dividing them into paragraphs or "stanzas". There should be 2 lines of text in each paragraph. Single space the words to the song by putting a paragraph break <p> after the following words: *gleaming, streaming, there, and brave*. You will also insert a
 tag at the end of the first line of each paragraph or stanza. . A
 tag will enter a new return, but will not give you a blank line.
- Add another horizontal rule the same size as before.
- Change the font to "garamond", size 2 and color black. Type: *Page created by Student Name*.
- The entire page should be centered aligned except the "Page created...." line which will be right aligned. To right align this paragraph, insert a <p align=right> tag before the text.
- Save the file as **star.htm** and view it in the Browser.
- **Have your Instructor check this assignment off of your screen. You do not need to print as the white text won't print on white paper.**
